SEED COATING INSIGHTS

THURSDAY

FEBRUARY 12TH, 2026

TEK™ COATING ISN'T ABOUT REINVENTING YOUR OPERATION, IT'S ABOUT HELPING YOUR SEED GET OFF TO A BETTER START, SO YOUR PLANTS CAN FINISH STRONG.

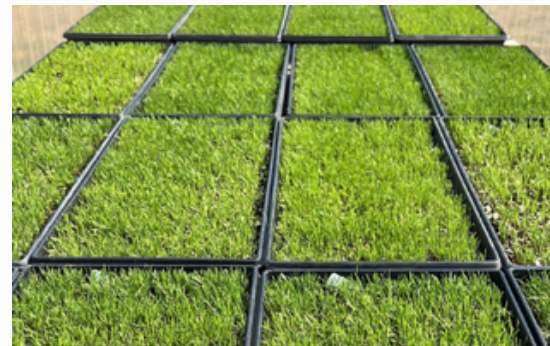

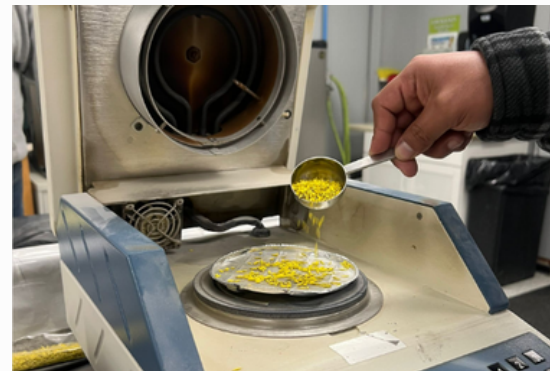

Planting rarely happens in perfect growing conditions. Weather changes, uneven moisture, and poor soil contact can prevent seed from getting a strong start. Tek™ Coating was built to help seed handle those challenges. A lot of stand problems start right after planting. Seed can be planted unevenly, on overly dry ground, and nutrients sometimes aren't available when seedlings need them most. When that happens, you end up with thin, patchy stands.

Tek™ Coating works where it matters most, right on the seed. The coating holds performance enhancing ingredients directly on each seed. That means the seed has what it needs the moment it starts to grow, instead of waiting for nutrients to move through the soil.

Early access to nutrients helps seedlings develop stronger roots and shoots. The beneficial microbes help unlock nutrients in the soil and support healthier root systems, which can also reduce early disease pressure.

When Tek™ is paired with AquaTEKsc™, early seed performance is further enhanced. AquaTEKsc™ improves moisture capture and keeps water close to the seed, helping germination when moisture is limited or uneven.

Tek™ Coating can be customized for different crops, soils, and growing goals. The result is easier planting, more consistent emergence, and stronger, more uniform stands.
